### High-Level Indicators

**Indicators Related to Three Intervention Pillars**

1. **TIPPING POINT**
   - ASRHR
   - Alternative Movement
   - Building Opportunities

### Results / Outcomes

**Nepal and Bangladesh Impact Indicator**

- % of married and unmarried adolescent boys and girls

**Nepal-Specific Additional Impact**

- Average Age of Adolescent Girls and Boys at the Time of Gauna

**Results / Outcomes**

- Increased agency of adolescent girls to decide and act on their own visions for their lives and futures
- Behavior by parents and adolescent boys is supportive of girls’ equality and rights
- Weakening of gendered social norms that limit adolescent girls’ lives
- Increased agency of adolescent boys to decide and act on their own visions for their lives and futures

### Outputs

**Nepal-Specific Outputs**

- Adolescent boys’ increased confidence, knowledge and skills
- Adolescent girls’ family members increased understanding of adolescent girls’ rights and aspirations
- Increased collective action by girls, boys and parents to shift social norms
- Adolescent boys’ increased confidence, knowledge and skills

### Nepal-Specific Additional Outputs

- % of adolescent girls reporting high self-efficacy
- % of adolescent girls reporting confidence that they can refuse marriage if they do not desire it
- % of adolescent girls scoring high on the Female Mobility Scale
- % of adolescent girls who report participation in financial decision making in the household
- % of adolescent girls who report receiving money or goods for work
- % of adolescent girls reporting participation in collective action in their community
- % of adolescent girls (and boys in Nepal) reporting parents’ equitable treatment of sons and daughters
- % of adolescent girls who report that their parents are supportive of their aspirations
- % of adolescent girls who report feeling “connected” with their parents/family
- % of adolescent boys reporting gender-equitable behaviors (Nepal only)
- % of boys reporting respectful communication with adolescent girls (Nepal only)
- % of boys reporting perpetration of sexual harrassment of girls (Nepal only)
- % of adults in the community reporting that most people in their community would disapprove of girls’ exercising their rights to the following:
  - walk around their village alone
  - ride bicycles or play sports
  - give input into decisions about marriage
  - take collective action for girls’ rights
  - talk with an adolescent boy
- % of adults in the community reporting that most people in their community would disapprove of parents who:
  - reject a promising marriage proposal for their daughter when the daughter does not attend school or after a perceived challenge to family honor
  - allow their daughter to engage in behaviors that challenge social norms

### Nepal-Specific Results/Outcomes

- % of adolescent boys reporting high self-efficacy
- % of adolescent boys reporting confidence that they can refuse marriage if they do not desire it
- % of adolescent boys reporting participation in collective action in their community
- % of adolescent boys who report feeling “connected” with their parents/family (this includes perceived closeness with their parents) (SADD)

### Notes

- *Indicators are listed as percentages; however note that our determination of the indicators will come from correlation analyses comparing data from areas which received the “intensive” package with the control (non-intervention) areas as well as with the “light” package areas. All the indicators will have data gathered by the baseline/endline (RCT) except those indicators with an asterisk, which will have data only gathered by the project monitoring system. Although nearly all indicators are framed quantitatively, note that for some indicators qualitative data will be collected through the baseline/endline process in addition to the quantitative data.
- **“Adolescent girl” refers to girls aged 12 to under-16 in Bangladesh at the time of baseline, and girls aged 12- under 17 in Nepal. Endline will be conducted 12 months after the end of the 18 month intervention; therefore the girls will be approximately 2.5 years older.
